1 Description of the Work

Computer vision applications need parallel computation to perform in reasonable response time. In order to satisfy that performance, developers use libraries like OpenCL and CUDA which move the computation load to GPU. However high performance GPU intensive computation on Android platform is a tough issue because of hardware dependencies and incompatibilities of libraries. For instance OpenCL GPU computation library is not supported on all Android devices. So, creating hardware independent applications using OpenCL is simply impossible. Because of those restrictions mentioned above, Renderscript computation module is presented by Google in 2011. It is a hardware-independent computation engine that operates at the native level. But there is no vision library written in Renderscript.

reVision is an open source, Renderscript powered computer vision library that can operate on all Android devices. It contains ready to use computer vision algorithm implementations with their sample applications. The vision algorithms are implemented in Renderscript. Also all Renderscript parts have their own Java parts for outer communication with Android platform.

Response times of reVision modules are small enough to process video streams in real time with minimum data loss. It also can be used in non-blocking way to not affect the other functionalities of client applications.

2 Project Management

2.1 Overall Strategy

reVision's iterative development process consist of project management and planning, requirement analysis, implementation and testing. Each iteration results in at least one new module with its sample application.

Summary of an iteration is described below.

Planning: The scope of the module to be written, desired specs and details are discussed.

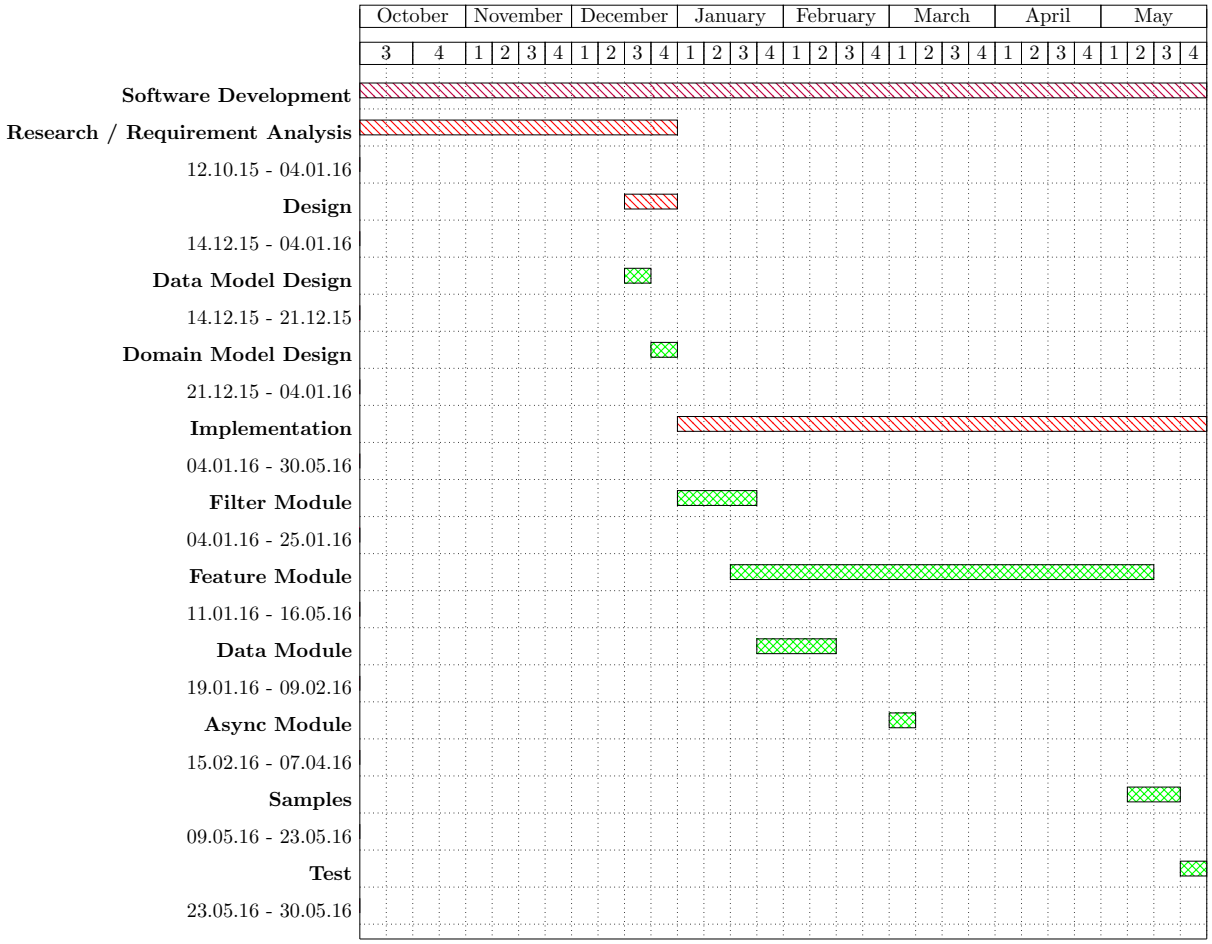
Requirement Analysis: The output of the module, needed arguments and optional specs are discussed.

Implementation: The module and its sample application is implemented.

- Modules are main objectives of the every iteration.
- Proceed every iteration with phases such as: Design, Implement, Test and Evaluate.

Testing: The module and the sample application are validated via unit tests.

2.2 Gantt Chart



2.3 Detailed Work Description

2.3.1 Work Package List

Work Package No	Work Package Title	Type of Activity[1]	Lead Participant No	Lead Participant Short Name	Person weeks[2]	Start Month	End Month
WP-1	Research and Requirement Analysis	MGT	1-2-3	AA-OT-UA	13	1	4
WP-2.1	Data Model Design	SUPP	1-2-3	AA-OT-UA	1	3	3
WP-2.2	Domain Model Design	SUPP	1-2-3	AA-OT-UA	2	3	4
WP-3.1	Filter Module	SUPP	2	OT	3	4	4
WP-3.2	Feature Module	SUPP	1-2-3	AA-OT-UA	18	4	8
WP-3.3	Data Module	SUPP	1	AA	3	4	5
WP-3.4	Async Module	SUPP	3	UA	3	5	6
WP-3.5	Samples	SUPP	1-2-3	AA-OT-UA	2	8	8
WP-4	Testing	MGT	1-2-3	AA-OT-UA	1	8	8
TOTAL					**46**		

[1] **SUPP** stands for Support activities; **MGT** stands for Management of the consortium.
[2] The total number of person-weeks allocated to each work package.

2.3.2 Deliverable List

Deliverable No	Deliverable Name	WP No	Nature[1]	Dissemination Level[2]	Delivery Date
D-1	Requirement Design Documents	WP-1	R	CO	24.12.2016
D-2.1	Data Model Design	WP-2.1	R	CO	21.12.2016
D-2.2	Domain Model Design	WP-2.2	R	CO	04.01.2016
D-3.1	Filter Module Implementation	WP-3.1	P	PU	25.01.2016
D-3.2	Feature Module Implementation	WP-3.2	P	PU	16.05.2016
D-3.3	Data Module Implementation	WP-3.3	P	PU	09.02.2016
D-3.4	Async Module Implementation	WP-3.4	P	PU	07.04.2016
D-3.5	Samples	WP-3.5	D	PU	23.05.2016

[1] **R** = Report, **P** = Prototype, **D** = Demonstrator

[2] **PU** = Public, **CO** = Confidential, only for members of the consortium(including the Commission Services)

2.3.3 Milestones List

Milestone Number	Milestone Name	Work Package(s) Involved	Expected Date	Means of Verification
M1	Prototype	-	17.12.2015	Validated by supervisor
M2	Filter Module	WP-3.1	04.01.2016	Validated by supervisor
M3	Feature Module	WP-3.2	16.05.2016	Validated by supervisor
M4	Data Module	WP-3.3	09.02.2016	Validated by supervisor
M5	Async Module	WP-3.4	07.04.2016	Validated by supervisor
M6	Samples	WP-3.5	23.05.2016	Validated by supervisor

2.3.4 Work Package Descriptions

Work Package Number	WP-1	**Start Date:**		12.10.2015
Work Package Title	Research and Requirement Analysis			
Activity Type	MGT			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	13 weeks	13 weeks	13 weeks	

Objectives

- Determining the project scope, gathering information about the project, determining requirements and analysis.

Description of work
Task-1: Determine the project scope
Task-2: Research about similar works
Task-3: Making a requirement analyses.
Task-5: Determine the main modules.

Deliverables

- Documentation of project description, its scope and requirements.

Work Package Number	WP-2.1	**Start Date:**		14.12.2015
Work Package Title	Data Model Design			
Activity Type	SUPP			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	1 week	1 week	1 week	

Objectives

- Determining data structures that can be commonly used with computer vision algorithms.

Description of work
Task-1: Decide data structures
Task-2: Discuss the functionalty

Deliverables

- Data model.

Work Package Number	WP-2.2	**Start Date:**		21.12.2015
Work Package Title	Domain Model Design			
Activity Type	SUPP			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	2 weeks	2 weeks	2 weeks	

Objectives

- Determine the classes and their attributes.

Description of work
Task-1: Determine the classes and their attributes.
Task-2: Determine the relationships among classes

Deliverables

- Domain model.

Work Package Number	WP-3.1	**Start Date:**		04.01.2016
Work Package Title	Filter Module			
Activity Type	SUPP			
Participant Number	2			
Participant Short Name	OT			
Person-weeks per participant:	3 weeks			

Objectives

- Implement image filters that are used by other modules.

Description of work
Task-1: Implement image filters.

Deliverables

- Filter Module

Work Package Number	WP-3.2	**Start Date:**		11.01.2016
Work Package Title	Feature Module			
Activity Type	SUPP			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	18 weeks	18 weeks	18 weeks	

Objectives

- Implement computer vision algorithms to extract features on image data.

Description of work

Task-1: Implement Harris corner detection algorithm.
Task-2: Implement FAST corner detection algorithm.
Task-3: Implement SIFT extractor.
Task-4: Implement SIFT matcher.
Task-5: Implement blob detection algorithms.

Deliverables

- Feature Module

Work Package Number	WP-3.3	**Start Date:**		19.01.2016
Work Package Title	Data Module			
Activity Type	SUPP			
Participant Number	1			
Participant Short Name	AA			
Person-weeks per participant:	3 weeks			

Objectives

- Implement data structures that are commonly used with computer vision algorithms.

Description of work

Task-1: Implement data structures.
Task-2: Provide functions for data structures to manipulate them.
Task-3: Implement helper classes to make data structures compatible with Renderscript API.

Deliverables

- Data Module

Work Package Number	WP-3.4	**Start Date:**		15.02.2016
Work Package Title	Async Module			
Activity Type	SUPP			
Participant Number	3			
Participant Short Name	UA			
Person-weeks per participant:	3 weeks			

Objectives

- Implement ready to use async holder classes for core functionalities.

Description of work
Task-1: Implement Async class with respect of concurrency principles

Deliverables

- Data Module

Work Package Number	WP-3.5	**Start Date:**		09.05.2016
Work Package Title	Samples			
Activity Type	SUPP			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	2 weeks	2 weeks	2 weeks	

Objectives

- Provide sample Android applications for all functionalties of the library.

Description of work

Task-1: Implement Android application for all core features.

Deliverables

- Sample Applications

Work Package Number	WP-4	**Start Date:**		23.05.2016
Work Package Title	Test			
Activity Type	SUPP			
Participant Number	1	2	3	
Participant Short Name	AA	OT	UA	
Person-weeks per participant:	1 week	1 week	1 week	

Objectives

- Write unit tests for all modules.

Description of work

Task-1: By writing unit tests validate that all modules work correctly.

Deliverables

- -

2.3.5 Summary Effort Table

P. short name	WP-1	WP-2.1	WP-2.2	WP-3.1	WP-3.2	WP-3.3	WP-3.4	WP-3.5	WP-4	Total person-weeks
AA	13	1	2	-	18	3	-	2	1	40
OT	13	1	2	3	18	-	-	2	1	40
UA	13	1	2	-	18	-	3	2	1	40

2.4 Pert Diagram

2.5 Risk Management

The development team is unexperienced on computer vision field, so some learning period is required in multiple phases of the project. Especially developing modules that contain algorithms having steep learning curve will take remarkable time in the process. For this reason it is crucial to comply with the schedule.

3 Methodology and Analysis

3.1 Feasibility Study

reVision is an open source and non-profit project so there is no need to examine the financial feasibility. The project is analyzed only in operational and technical sides.

3.1.1 Operational Feasibility

Computer vision developers feel the lack of a decent computer vision library on Android platform. Creating a high performance computer vision application on Android takes too much effort. This project, if succeeds will become a ready to use and collaborative tool for Android developers.

3.1.2 Technical Feasibility

Widely used libraries for computer vision and GPU computing such as OpenCV, OpenCL, and CUDA, cannot be used on Android platform because of incompatibilities of devices and lack of drivers. For this reason a new GPU computing engine named Renderscript was presented. But Renderscript does not have a complete computer vision library.

reVision uses Renderscript for data-parallel GPU computations. Since Renderscript technology is hardware and version independent among all recent Android devices, reVision can also be used universally on every Android device. The runtime frame-rates vary between different devices but reVision is ensured to work at the most efficient way that the device is capable of.

3.2 The Process Model and Its Particular Adaptation

According to R. S. Pressman there are several process model types including linear sequential model, prototype model, evolutionary models and etc. In real life most them are used according to the project necessities and requirements.

reVision is being developed using incremental model which is an evolutionary model. Every release is published after a work cycle which includes all the phases of the software development process. Each release extends the project with at least one module or functionality with its sample application.

Incremental model is suitable for this project because the project team is not experienced in the computer vision field. The incremental model gives the team, the option of refactoring the design and evolving the project over time, which the other models would not give.

The development cycle can simply be clarified with following steps; Requirement analysis, Planning, Design, Implementation and Testing. Every development iteration of reVision include each one of those steps.

3.3 Functional and Non-Functional Requirements

3.3.1 Functional Requirements

3.3.2 Non-Functional Requirements

Performance Requirements: The response time problem were the thing that triggered the creation of reVision project. Without reasonable performance, reVision could not be considered successful. To achieve the desired performance, developers implement and use all performance related modules such as implementing Async Model or using Renderscript framework. The performance is the single most important non-functional requirement of reVision.

Reliability Requirements: The responses of reVision modules must be correct and precise.

Usability Requirements: The function arguments and the Android communication modules must be easy to understand and to use. Since it is a library, every function has to be well documented. Also the sample applications have to be complete and ready to test for users.

3.4 Use Cases

Use Case No	1
Use Case Name	Filter Image
Actor	User
Preconditions	Retrieve data in an appropriate way
Postconditions	Return filtered image data
Scenario	User gets filtered image

Use Case No	2
Use Case Name	Detect Corners with Harris Algorithm
Actor	User
Preconditions	Retrieve data in an appropriate way
Postconditions	Return image with corner data
Scenario	Locate all local maxima of the filtered image, then mark the highest N on the image

Use Case No	3
Use Case Name	Detect Corners with FAST Algorithm
Actor	User
Preconditions	Retrieve data in an appropriate way
Postconditions	Return image with corner data
Scenario	User gets the image marked by FAST corner detection results

Use Case No	4
Use Case Name	Feature matching with SIFT descriptors
Actor	User
Preconditions	Retrieve data in an appropriate way
Postconditions	Return the image back with markers
Scenario	User gets the match of image extracted before

Use Case No	5
Use Case Name	Track a specific object
Actor	User
Preconditions	Retrieve data in an appropriate way
Postconditions	Return the image back with an object marker
Scenario	User tracks a specific object

Use Case No	6
Use Case Name	Understand functionality of the library with sample applications
Actor	User
Preconditions	-
Postconditions	-
Scenario	User understands the functionality of the library with sample applications
